

Maximize the organs transplanted per donor through optimizing ICU donor management.

- Implement structured communication during donor management between OPO and hospital care team (huddles, continuous bedside communication, follow up).
- Treatment transfers from cerebral resuscitation efforts to optimizing organ function for subsequent transplantation.
- Clinical expertise, vigilance, flexibility, and the ability to address multiple complex clinical issues simultaneously and effectively.
- Balance the competing management priorities between different transplantable organs.
- Stabilize the profound physiologic and homeostatic imbalances incited by brain death.
- Treatment transfers from cerebral resuscitation efforts to optimizing organ function for subsequent transplantation

The number of transplants needed continues to grow faster than organs available for donation.

LET'S FILL THE GAP!

Coming Together

to optimize Organ Donation
